

Agent \$DOG

A safety-first AI trading agent for \$DOG on Kraken · DOGUSD (Bitcoin Runes)

This guide explains **every screen, module, button and control** of the Agent DOG dashboard. The agent reads the market and prepares a plan; **you always make the final decision**. Built entirely on the **Kraken CLI**, deterministic, paper-first.

“We don't optimize for profit. We optimize for not losing your sats.” — Agent DOG runs read-only and paper-first; it never places a live order on your behalf.

SECTION	WHAT YOU'LL LEARN
1 · Overview	The safety model and the six-role “Pack”.
2 · Header & controls	Status badges, refresh/auto, Settings, and the expandable navigation.
3 · Intent & Trade Plan	The decision, the Preview-trade flow, and placing it on Kraken.
4 · Multi-Agent Vote	The deterministic 4-agent weighted vote with a Risk veto.
5 · Live Cockpit	Pack Index, Decision Engine, Market Data and Portfolio.
6 · Kraken read-only	View your real balance, safely (read-only) — with a hide switch.
7 · Intelligence	Pair verification and read-only market context.
8 · Ask Sage	The optional AI co-pilot (explain-only).
9 · Activity & P&L	The paper trade history and realized performance.
10 · Settings & layout	Customising the dashboard and preferences.
11 · Safety	The rules enforced in code.

1 Overview & the safety model

Agent DOG is a **read-only co-pilot** for trading \$DOG (DOGUSD) on Kraken. It reads the market and produces a **deterministic** decision — the same data always yields the same call — then prepares a ready-to-place trade plan. It does not, and cannot, execute orders itself.

Why safety-first

Most bots optimise for returns and trade autonomously — the fastest way to wipe a retail account. Agent DOG inverts that: it does the analysis, but every action stops at a **human gate**. The worst outcome isn't a missed trade; it's an agent that loses your money unattended.

The Pack — six roles, one rule

ROLE	RESPONSIBILITY
 Beacon	Reads the live DOGUSD market from Kraken — price, bid/ask, spread, range, volatility, volume.
 Compass	Computes the deterministic decision and confidence via the multi-agent vote (section 4).
 Anchor	The safety gate — enforces paper-only and human confirmation; blocks autonomous execution.
 Helm	Stages the command for review. Nothing is sent without an explicit human action.
 Sage	The on-dashboard AI co-pilot — explains every score, factor and decision in plain language.
 You	The final gate. You read, you decide, you place the order on Kraken yourself.

Deterministic, by design. Every decision traces back to its inputs — no hidden model state, no surprises.

The four decisions

CALL	MEANING · WHAT YOU DO
WATCH_BUY	Conditions look favourable — confidence and the vote lean toward an entry. Watch.
HOLD	Stay with your current position. No new action needed.
NO_TRADE	No clear edge (e.g. near the 24h high). Stay out and wait.
RISK_OFF	The Risk agent's veto fired (volatility > 15% or spread > 1%). Protect capital.

2 Header & top controls

The top bar shows live status and global controls. The collapsible left rail is the navigation.

Figure 1 — The header: brand, status badges, refresh controls and mode badges.

CONTROL	WHAT IT IS / WHAT IT DOES
● Pack Active	Live status light — the agent is running and reading the market.
UTC clock	Current UTC time, so every reading has an unambiguous timestamp.
↻ Refresh Now	Button — forces an immediate refresh of all data and the decision.
Auto: ON	Toggle — automatic refresh on/off (data otherwise updates every few seconds).
Cycles · Last · Regime	Refresh count this session, the previous decision, and the market regime (TRENDING / RANGE / VOLATILE).
Badges	✓ Kraken CLI (data source) · 🔒 Read-only (no orders) · DOGUSD (\$DOG Runes, not Dogecoin).
✏ Edit layout	Button — enter customisation mode (drag, hide, reset). See section 9.

Expandable navigation rail

Click  on the left rail to expand it and reveal the page names. Jump to any section with a smooth scroll: **Right Now** → **Overview** → **AI Vote** → **Explore** → **Ask AI** → **Performance** → **Activity** → **Safety**. A  **Settings** gear sits at the bottom of the rail (section 9). The active section highlights as you scroll.

3 Current Intent & the Trade Plan

Figure 2 — Current Intent, the deterministic factors, and the two action buttons.

ELEMENT	WHAT IT IS / WHAT IT DOES
Current Intent	The agent's current stance — e.g. "RISK_OFF — high risk detected · waiting for human confirmation".
Why? factors	The exact deterministic inputs: confidence vs the 70% threshold, risk , momentum , volatility .
⚓ Preview trade	Button — opens the Trade Plan (entry, stop-loss, take-profit). Computes only; never executes.
Trade on Kraken ➤	Button — opens the DOGUSD page on Kraken Pro so you place the order yourself.

The Trade Plan window

CONTROL	FUNCTION
BUY / SELL	Choose the direction; the plan recomputes.
Your capital	Input your account size; position size = 5%.
Entry / SL / TP	Entry, stop-loss (volatility-based), take-profit (R:R 1.5).
📄 · 📄 Copy plan	Copy a single value, or the whole plan.
🦊 Explain this plan	With an LLM key, Sage explains the setup.
Open on Kraken ➤	Opens Kraken Pro to place the bracket order.

Placing the trade — 4 steps

- 1 Tap 📄 on **Entry** → paste into Kraken's **Limit price**
- 2 Tap 📄 on **Quantity** → paste into **Volume**
- 3 Add the **Stop-loss** and **Take-profit** (bracket order)
- 4 Review and press **Buy / Sell** on Kraken yourself

4

The deterministic Multi-Agent Vote

The decision is a transparent, weighted vote of four agents — no black box, 100% reproducible.

Figure 3 — Multi-Agent Vote: weighted bars, per-agent cards, and the Risk veto.

AGENT	WEIGHT · WHAT IT MEASURES
Trend	30% — price vs VWAP (above/below fair value).
Momentum	25% — position within the 24h range.
Liquidity	20% — volume and spread (ease of entry/exit).
Risk	25% — volatility, spread and flags. Holds a veto.

The Risk veto. If volatility > 15% or spread > 1%, the Risk agent overrides the vote → **RISK_OFF**, regardless of the others. Safety beats opportunity.

Each agent shows its stance (BUY / HOLD / AVOID), score and contribution; the weighted result drives the Decision Engine. With an LLM key, **Explain this vote** has Sage narrate the result — explanation only, never changing the call.

5

The Live Cockpit

Figure 4 — The Live Cockpit, refreshed live from Kraken.

MODULE	WHAT IT SHOWS / HOW TO READ IT
Pack Index	A 0–100 health score from four bars — Liquidity , Momentum , Risk (higher = safer), Readiness .
Decision Engine	The deterministic call with a confidence ring — bullish only above the 70% threshold.
Market Data	Live bid / ask, spread , 24h high/low, VWAP , volume and trade count.
Portfolio	A simulated paper account by default — current value, starting balance, unrealised P&L, trades, open orders.

The portfolio has a **Paper** / **Kraken** toggle to switch to a read-only view of your real balance — see the next page.

6

Paper / Kraken read-only portfolio

By default the portfolio is a simulated **paper** account. You can connect a read-only Kraken key to see your **real** balance — safely.

How it works

Add a read-only Kraken key (*Query Funds only*) to `.env`, then use the **Paper /  Kraken** toggle on the portfolio card. The dashboard reads your balance via `kraken balance` and shows your **\$DOG** holdings (with USD value), USD cash and other assets.

It can never touch your funds. A read-only key **cannot trade or withdraw**, and the dashboard only ever calls read endpoints. The  **toggle** blurs every amount for privacy (shown below).

Figure 5 — Kraken read-only portfolio, amounts hidden via the  toggle.

ELEMENT	WHAT IT SHOWS
✓ Connected	Confirms the read-only link — read-only, never trades or withdraws.
\$DOG value · held · USD cash	Your real balance, from <code>kraken balance</code> + the live price.
 toggle	Hides / shows all amounts for privacy (saved in your browser).

7

Market Intelligence & Ask Sage

Read-only context that backs every decision — none of it can place an order.

Figure 6 — Pair Verification (live via Kraken CLI).

MODULE	WHAT IT SHOWS
Pair Verification	Confirms DOGUSD is the \$DOG Bitcoin Runes pair (base DOG) with fees, tick size and live spread — via <code>kraken pairs</code> + <code>kraken spreads</code> .
BTC Network	Bitcoin fees, mempool and recent blocks (mempool.space); BTC price via Kraken CLI.
Live Trades · Pulse · MTF	The DOGUSD trade tape, RSI / EMA / VWAP, and the 15m/1h/4h trend. Informational only.
Perpetual	PF_DOGUSD mark price, funding and open interest. Read-only.

8

Ask Sage — the AI co-pilot

 **Sage** explains the vote, scores and trade plans in plain language — **explain-only, never in the decision loop**.

Figure 7 — Ask Sage: quick-ask bar, FAQ shortcuts and live answers.

CONTROL	FUNCTION
AI: ON / OFF	Sage works with built-in answers; an LLM key (<code>ANTHROPIC_API_KEY</code>) unlocks live answers — explain-only.
FAQ shortcuts	One-tap explanations: Pack Index, why HOLD, RSI/EMA/VWAP, paper trading, is it safe, what is \$DOG.
Ask anything	A free-text box answering from the live state — plus a quick-ask bar at the top of the dashboard. Press ▲ Hide to collapse a long answer.

Sage **explains, it never decides**. The deterministic Compass stays in charge; the human stays in control.

9

Activity & Track Record

A full, honest record of the pack's paper trades — fees included.

Figure 8 — Activity: paper trade history with realized P&L.

COLUMN / METRIC	WHAT IT SHOWS
Time · Side · Volume · Price · Cost	Every filled paper trade, newest first — via kraken paper history .
Realized P&L	Net result of closed trades, fees included — green for gain, red for loss.
Win rate · Fees	Share of profitable closes and total fees paid.

All figures are **paper** (simulated) — no real money. The Track Record card shows the same realized P&L as a chart.

10 Customise & Settings

Edit layout

Press  **Edit layout** to drag-reorder cards, hide any card with **X** (it moves to a tray), restore it from the tray, or  **Reset** to defaults. Saved automatically in your browser.

Settings (⚙ gear, left rail)

Figure 9 — Settings: AI provider, key status, panels, profile, reset, about.

SETTING	WHAT IT DOES
AI Co-Pilot	Choose the LLM and see the key status (read from <code>.env</code> ; never stored in the browser).
Panels	Show / hide Multi-Agent Vote, Trade Plan actions, Ask Sage.
Profile · Reset · Replay tutorial	A local display name, a one-click dashboard reset, and replaying the welcome tour.

The “Show .env line” helper builds the config line locally — your key is **never stored in the browser nor sent from the page**.

11

Safety — enforced in code

Figure 10 — Pack Safety Rules.

RULE	WHY IT MATTERS
Max 5% / trade	Caps the damage any single position can do.
Volatility > 15% → RISK_OFF	The Risk veto pulls the agent out of dangerous conditions.
DOGUSD only	One pair — no scope-creep; Dogecoin (XDGUSD) is rejected.
Human --confirm	No order is sent without an explicit human action.
Read-only dashboard	Every endpoint is GET; the dashboard physically cannot place an order.
Keys optional & read-only	Runs with no key. Optional keys are read-only (Kraken: Query Funds) or explain-only (LLM) — never trade or withdraw.

What Agent DOG will never do: enable live trading · auto-execute a trade · place an order from the dashboard · withdraw funds · override its own deterministic decision.

Agent \$DOG — the agent that protects your sats.
