

# Agent \$DOG

A safety-first AI trading agent for \$DOG on Kraken · DOGUSD (Bitcoin Runes)

This guide explains **every screen, module, button and control** of the Agent DOG dashboard — what each one is, what it does, and why it matters. The agent reads the market and prepares a plan; **you always make the final decision.**

“We don't optimize for profit. We optimize for not losing your sats.” — Agent DOG runs read-only and paper-first; it never places a live order on your behalf.

## 1 Overview & the safety model

Agent DOG is a **read-only co-pilot** for trading \$DOG (DOGUSD) on Kraken. It works continuously to read the market and produce a **deterministic** decision — the same data always yields the same call — and then prepares a ready-to-place trade plan. It does not, and cannot, execute orders itself.

### Why safety-first

Most bots optimise for returns and trade autonomously — the fastest way to wipe a retail account. Agent DOG inverts that: it does the analysis, but every action stops at a **human gate**. The worst outcome for a Kraken user isn't a missed trade; it's an agent that loses their money unattended.

### The Pack — six roles, one rule

| ROLE                                                                                             | RESPONSIBILITY                                                                                 |
|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
|  <b>Beacon</b>  | Reads the live DOGUSD market from Kraken — price, bid/ask, spread, range, volatility, volume.  |
|  <b>Compass</b> | Computes the deterministic decision (WATCH_BUY / HOLD / NO_TRADE) and a confidence score.      |
|  <b>Anchor</b>  | The safety gate — enforces paper-only and human confirmation; blocks all autonomous execution. |
|  <b>Helm</b>    | Stages the command for review. Nothing is sent without an explicit human action.               |
|  <b>Sage</b>    | The on-dashboard AI co-pilot — explains every score, factor and decision in plain language.    |
|  <b>You</b>     | The final gate. You read, you decide, you place the order on Kraken yourself.                  |

**Deterministic, by design.** Every decision can be traced back to its inputs. There is no hidden model state and no surprise — the dashboard always shows you the exact factors behind a call.

### The three decisions

| CALL             | MEANING · WHAT YOU DO                                                                        |
|------------------|----------------------------------------------------------------------------------------------|
| <b>WATCH_BUY</b> | Conditions look interesting but confidence is still below 70%. <b>Watch — don't buy yet.</b> |
| <b>HOLD</b>      | Stay with your current position. No new action needed.                                       |
| <b>NO_TRADE</b>  | Poor or too-volatile conditions. <b>Stay out</b> and protect capital.                        |

### Read the dashboard in 30 seconds

- 1 Glance at the **Pack Index** (0–100) and the **Decision Engine** call.
- 2 Read **Current Intent** — the “Why?” factors show the exact reasoning.
- 3 To act, press **Preview trade** for a full plan (entry, stop-loss, take-profit).
- 4 Place it yourself on Kraken — the agent never trades for you.

## 2 Header & top controls

The top bar shows live status and the global controls. Left rail = navigation.

Figure 1 — The header: brand, status badges, refresh controls and mode badges.

| CONTROL          | WHAT IT IS / WHAT IT DOES                                                                  |
|------------------|--------------------------------------------------------------------------------------------|
| ● Pack Active    | Live status light — the agent is running and reading the market.                           |
| UTC clock        | Current UTC time, so every reading has an unambiguous timestamp.                           |
| ↻ Refresh Now    | <b>Button</b> — forces an immediate refresh of all market data and the decision.           |
| Auto: ON         | <b>Toggle</b> — turns automatic refresh on/off (data otherwise updates every few seconds). |
| Cycles           | How many refresh cycles have run this session — proof the agent is working live.           |
| Last             | The previous decision and its confidence, for quick comparison.                            |
| Regime           | Market regime — TRENDING, RANGE or VOLATILE — derived from volatility & momentum.          |
| ✓ Kraken CLI     | Badge — confirms data comes from the official Kraken CLI / feed.                           |
| 🔒 Read-Only Mode | Badge — the dashboard cannot place orders. Always on.                                      |
| DOGUSD           | Badge — the single pair the agent trades (\$DOG Runes, not Dogecoin).                      |
| ✎ Edit layout    | <b>Button</b> — enter customisation mode (drag, hide, reset). See section 6.               |

### Left navigation rail

The six icons on the far left jump you to each part of the dashboard with a smooth scroll: **Intent** → **Cockpit** → **Market** → **Track Record** → **Sage** → **Safety**. The active section is highlighted as you scroll.

### 3 Current Intent & the Trade Plan

Figure 2 — Current Intent, the deterministic factors, and the two action buttons.

| ELEMENT           | WHAT IT IS / WHAT IT DOES                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Current Intent    | The agent's current stance — e.g. “HOLD DOG — no autonomous execution”.                                                          |
| Why? factors      | The exact deterministic inputs: <b>confidence</b> vs the 70% threshold, <b>risk</b> score, <b>momentum</b> , <b>volatility</b> . |
| ⚙️ Preview trade  | <b>Button</b> — opens the Trade Plan (entry, stop-loss, take-profit). Computes only; never executes.                             |
| Trade on Kraken ➔ | <b>Button</b> — opens the DOGUSD page on Kraken Pro so you can place the order yourself.                                         |

#### The Trade Plan window

| CONTROL          | FUNCTION                                                                 |
|------------------|--------------------------------------------------------------------------|
| BUY / SELL       | Choose the direction; the plan recomputes for that side.                 |
| Your capital     | Input your account size; position size = 5% of it.                       |
| Entry / SL / TP  | Computed entry, stop-loss (volatility-based) and take-profit (R:R 1.5).  |
| 📄 (per value)    | Copies that exact number, ready to paste into the matching Kraken field. |
| 📄 Copy plan      | Copies the whole plan as text.                                           |
| Open on Kraken ➔ | Opens Kraken Pro to place the bracket order.                             |

#### Placing the trade — 4 steps

- 1 Tap 📄 on **Entry** → paste into Kraken's **Limit price**
- 2 Tap 📄 on **Quantity** → paste into **Volume**
- 3 Add the **Stop-loss** and **Take-profit** (bracket order)
- 4 Review and press **Buy / Sell** on Kraken yourself

4

The Live Cockpit

Figure 3 — The Live Cockpit: six modules, refreshed live from Kraken.

| MODULE                 | WHAT IT SHOWS / HOW TO READ IT                                                                                                                                                 |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Pack Index</b>      | A 0–100 health score from four bars — <b>Liquidity</b> (ease of entry/exit), <b>Momentum</b> (trend strength), <b>Risk</b> (higher = safer), <b>Readiness</b> (setup quality). |
| <b>Decision Engine</b> | The deterministic call with a <b>confidence ring</b> . The agent leans bullish only above the 70% confidence threshold.                                                        |
| <b>Market Data</b>     | Live bid / ask, the <b>spread</b> (tighter = cheaper), 24h high/low, <b>VWAP</b> (fair price), volume and trade count.                                                         |
| <b>Paper Portfolio</b> | A simulated account: current value, starting balance, <b>unrealised PnL (fees included)</b> , trades and open orders.                                                          |
| <b>Risk Analysis</b>   | Risk level, 24h volatility, spread and the 24h price range — the safety read at a glance.                                                                                      |
| <b>Agent Timeline</b>  | <b>Pack Consensus (2/3)</b> and the live status of Beacon · Compass · Anchor · Helm · Sage.                                                                                    |

The Decision Engine never overrides itself: it is computed from the same inputs every cycle. If a number looks surprising, the Why factors (section 3) and Sage (section 5) explain it.

5

Market Intelligence & Ask Sage

Read-only context that backs every decision — none of it can place an order.

Figure 4 — Market Intelligence modules.

| MODULE            | WHAT IT SHOWS                                                                              |
|-------------------|--------------------------------------------------------------------------------------------|
| < BTC Network     | Bitcoin fees, mempool and recent blocks — DOG is a Bitcoin Rune, so BTC conditions matter. |
| 🐕 Live Trades     | The real-time DOGUSD trade tape — buys and sells as they happen on Kraken.                 |
| 📊 Market Pulse    | RSI (overbought/oversold), EMA 9/21 (short trend), VWAP, and a volume impulse.             |
| 🕒 Multi-Timeframe | The 15m / 1h / 4h trend together. Informational — it never changes the deterministic call. |
| 📈 Perpetual       | PF_DOGUSD mark price, funding rate and open interest. Read-only, no orders ever.           |

Ask Sage — the AI co-pilot

| CONTROL      | FUNCTION                                                                                                                   |
|--------------|----------------------------------------------------------------------------------------------------------------------------|
| FAQ buttons  | One-tap answers: “What is Pack Index?”, “Why HOLD now?”, “What's RSI/EMA/VWAP?”, “Is Agent DOG safe?”, “What is \$DOG?”... |
| Ask anything | A free-text box — Sage answers using the <b>live dashboard data</b> . It explains and advises; it <b>never executes</b> .  |

6

## Customise the layout & Safety rules

### Edit layout — make it yours

Press  **Edit layout** in the header to enter edit mode. Your changes are saved automatically in the browser.

| ACTION  | HOW                                                     |
|---------|---------------------------------------------------------|
| Reorder | Drag any card to a new position within its row.         |
| Hide    | Click the ✕ on a card to hide it; it moves to the tray. |
| Restore | Click a chip in the tray to bring a hidden card back.   |
| ↶ Reset | Restore the original default layout in one click.       |

### Safety — enforced in code

Figure 5 — Pack Safety Rules.

| RULE               | WHY IT MATTERS                                                  |
|--------------------|-----------------------------------------------------------------|
| Max 5% / trade     | Caps the damage any single position can do.                     |
| Volatility cut-off | Above 15% volatility the agent flips to RISK_OFF.               |
| DOGUSD only        | One pair — no scope-creep into untested assets.                 |
| Human --confirm    | No order is sent without an explicit human action.              |
| Read-only UI       | The dashboard physically cannot place an order.                 |
| No API key         | It never asks for your secret keys, so it can never move funds. |

**What Agent \$DOG will never do:** enable live trading · auto-execute a trade · place an order from the dashboard · ask for your secret API keys · override its own deterministic decision.

**Agent \$DOG — the agent that protects your sats.**
